Sending information with forms

1. Create a web page with this information (**formulario.php**):

Create an array with the options of the select.

The options are, together with the value to store when the user selects an option:

- Java Programming (value=0).
- Web Design (value=1).
- Dockers administration (value=2).
- Django framework (value=3).
- Mongo database (value=4).

Build the select using a foreach of the previous array.

Apply security as described in w3schools. The "Name" is required.

2. When the user clicks on the button the data are sent to **manage.php**

manage.php shows a sentence like this, including the information from the previous form:

XXX wants to enrol in the following subjects: XXX, XXX, XXX

Link to a third web page, **manage2.php**.

3. The page **manage2.php** shows a preloaded form like the first one and a radio button with two options:

- In-person classes

- Distance classes

When the user clicks on the button it calls manage.php.

4. This time **manage.php** shows:

XXX wants to enrol in the following subjects: XXX, XXX, XXX and yyyy classes.

yyyy is the selected option.
